GENERAL INFORMATION

DIAGNOSTIC TROUBLE CODE INDEX - DTC: ELECTRIC PARK BRAKE CONTROL MODULE (EPBCM) (G1802123)

DESCRIPTION AND OPERATION

ELECTRIC PARK BRAKE CONTROL MODULE (EPBCM)

CAUTION:

Diagnosis by substitution from a donor vehicle is **NOT** acceptable. Substitution of control modules does not guarantee confirmation of a fault, and may also cause additional faults in the vehicle being tested and/or the donor vehicle.

NOTES:

- Guided Diagnostics must be followed and the repair advised by the process completed. Failure to do so may result in the rejection of any warranty claim made.
- If a control module or a component is suspect and the vehicle remains under manufacturer warranty, refer to the Warranty Policy and Procedures manual, or determine if any prior approval programme is in operation, prior to the installation of a new module/component.
- Generic scan tools may not read the codes listed, or may read only 5-digit codes. Match the 5 digits from the scan tool to the first 5 digits of the 7-digit code listed to identify the fault (the last 2 digits give extra information read by the manufacturer-approved diagnostic system).
- When performing voltage or resistance tests, always use a digital multimeter that has the resolution ability to view 3 decimal places. For example, on the 2 volts range can measure 1mV or 2 K Ohm range can measure 1 Ohm. When testing resistance always take the resistance of the digital multimeter leads into account.
- Check and rectify basic faults before beginning diagnostic routines involving pinpoint tests.
- Inspect connectors for signs of water ingress, and pins for damage and/or corrosion.
- If DTCs are recorded and, after performing the pinpoint tests, a fault is not present, an intermittent concern may be the cause. Always check for loose connections and corroded terminals.
- Check JLR claims submission system for open campaigns. Refer to the corresponding bulletins and SSMs which may be valid for the specific customer complaint and carry out the recommendations as required.

The table below lists all Diagnostic Trouble Codes (DTCs) that could be logged in the Electric Park Brake Control Module (EPBCM). For additional diagnosis and testing information, refer to the relevant Diagnosis and Testing section in the workshop manual. For additional information, refer to: Brake System (206-00 Brake System - General Information, Diagnosis and Testing) / Parking Brake (206-05 Parking Brake and Actuation - Vehicles Without: Carbon Ceramic Brakes, Diagnosis and Testing).

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
B1111-77	Electronic Park Brake Enable - Commanded position not reachable	**NOTE:** Fault is set when at least one brake is in brake state "unknown" or one brake is applied or fully applied while the other brake is released or fully released - Electric park brake left or right actuator circuit short circuit to ground, short circuit to power, open circuit, high resistance - Electric park brake left or right actuator failure - Rear left or rear right brake caliper failure	- Refer to the electrical circuit diagrams and check the electric park brake left and right actuator circuits for short circuit to ground, short circuit to power, open circuit, high resistance - Test the operation of the left and right electric park brake actuators - Test the operation of the rear left and rear right brake calipers - Drive brakes into defined state by switch - Hold switch in release position for approximately 3 sec
C1059-62	Left And Right Actuator - Internal Temperature Sensors - Signal compare failure	**NOTE:** Circuit reference - TEMP LH / TEMP RH - - Electric park brake control module connector pins corroded - Electric park brake left motor connector pins corroded - Electric park brake left actuator temperature sensor circuit, high resistance - Electric park brake right motor connector pins corroded - Electric park brake right actuator temperature sensor circuit, high resistance	**NOTE:** For this DTC to set the vehicle must be driven for a period of 10 minutes at 10kph. If the vehicle speed falls below 10kph the setting period must be done again. If after the setting period the temperature between the left and right actuators exceeds 30deg°C and one of the brakes is fully applied, the DTC will set - Refer to the electrical circuit diagrams and check the electric park brake control module connector pins for corrosion - Refer to the electrical circuit diagrams and check the electric park brake left motor connector pins for corrosion - Refer to the electrical circuit diagrams and check the electric park brake left actuator temperature sensor circuit for short circuit to ground, open circuit, high resistance - Refer to the electrical circuit diagrams and check the electric park brake right motor connector pins for corrosion - Refer to the electrical circuit diagrams and check the electric park brake right actuator temperature sensor circuit for short circuit to ground, open circuit, high resistance
C2005-09	Right Actuator - Component failures	- Electric park brake right actuator incorrectly installed - Electric park brake right actuator failure	- Check that the electric park brake right actuator is correctly installed - Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake right actuator
C2005-71	Right Actuator - Actuator stuck	- Electric park brake right actuator incorrectly installed - Electric park brake right actuator failure	- Check that the electric park brake right actuator is correctly installed - Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake right actuator

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
C2005-77	Right Actuator - Commanded position not reachable	▪ Low power supply voltage, battery/charging system fault ▪ Electric park brake right actuator incorrectly installed ▪ Electric park brake right actuator circuit open circuit, high resistance ▪ Electric park brake control module ground circuit open circuit, high resistance ▪ Electric park brake right actuator internal failure	**NOTE:** This DTC will set after detecting disc contact, but full clamping force is not reached within three seconds of the brake being applied. Or, if the target disc clamping force is not achieved within 25 seconds from start of park brake application ▪ Refer to the relevant section of the workshop manual and test the battery and charging system ▪ Check that the electric park brake right actuator is correctly installed. If the actuator is correctly installed, release and apply the electric parking brake several times ▪ Refer to the electrical circuit diagrams and check the electric park brake right actuator circuit for open circuit, high resistance ▪ Using the Jaguar Land Rover approved diagnostic equipment, check datalogger signal - Right Park Brake Motor Current (2B34) - and operate the electric park brake switch. If the signal is <15A refer to the electrical circuit diagrams and check the electric park brake control module ground circuits for open circuit, high resistance ▪ If the fault persists, install a new electric park brake right actuator as required
C2005-86	Right Actuator - Signal invalid	▪ Invalid data received by the electric park brake control module	**NOTE:** This DTC is for event information only and does not indicate a fault. ▪ No action necessary. Ignore this DTC
C2005-95	Right Actuator - Incorrect assembly	▪ Electric park brake right actuator incorrectly installed ▪ Rear right brake disc or pads incorrectly installed ▪ Electric park brake right actuator failure ▪ Battery/charging system fault	▪ Check that the electric park brake right actuator is correctly installed ▪ Check that the rear right brake disc and pads are correctly installed ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake right actuator
C2006-09	Left Actuator - Component failures	▪ Electric park brake left actuator incorrectly installed ▪ Electric park brake left actuator failure	▪ Check that the electric park brake left actuator is correctly installed ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake left actuator
C2006-71	Left Actuator - Actuator stuck	▪ Electric park brake left actuator incorrectly installed ▪ Electric park brake left actuator failure	▪ Check that the electric park brake left actuator is correctly installed ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake left actuator

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
C2006-77	Left Actuator - Commanded position not reachable	▪ Low power supply voltage, battery/charging system fault ▪ Electric park brake left actuator incorrectly installed ▪ Electric park brake left actuator circuit open circuit, high resistance ▪ Electric park brake control module ground circuit open circuit, high resistance ▪ Electric park brake left actuator internal failure	**NOTE:** This DTC will set after detecting disc contact, but full clamping force is not reached within three seconds of the brake being applied. Or, if the target disc clamping force is not achieved within 25 seconds from start of park brake application ▪ Refer to the relevant section of the workshop manual and test the battery and charging system ▪ Check that the electric park brake left actuator is correctly installed. If the actuator is correctly installed, release and apply the electric parking brake several times ▪ Refer to the electrical circuit diagrams and check the electric park brake left actuator circuit for open circuit, high resistance ▪ Using the Jaguar Land Rover approved diagnostic equipment, check datalogger signal - Left Park Brake Motor Current (2B33) - and operate the electric park brake switch. If the signal is <15A refer to the electrical circuit diagrams and check the electric park brake control module ground circuits for open circuit, high resistance ▪ If the fault persists, install a new electric park brake left actuator as required
C2006-86	Left Actuator - Signal invalid	▪ Invalid data received by the electric park brake control module	**NOTE:** This DTC is for event information only and does not indicate a fault. ▪ No action necessary. Ignore this DTC
C2006-95	Left Actuator - Incorrect assembly	▪ Electric park brake left actuator incorrectly installed ▪ Rear left brake disc or pads incorrectly installed ▪ Electric park brake left actuator failure ▪ Battery/charging system fault	▪ Check that the electric park brake left actuator is correctly installed ▪ Check that the rear left brake disc and pads are correctly installed ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake left actuator

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
C2007-01	Right Motor - General electrical failure	**NOTE:** Circuit reference - RH MOTOR + / RH MOTOR - / VBATT MOTOR RH / RH MOTOR GND - ▪ Fuse failure ▪ Electric park brake right actuator circuit open circuit, high resistance ▪ Electric park brake control module right actuator power or ground circuit open circuit, high resistance ▪ Electric park brake control module connectors damaged or corroded ▪ Electric park brake right actuator internal failure ▪ Electric park brake control module internal failure	▪ Refer to the electrical circuit diagrams and check the electric parking brake control module, right power supply fuse and circuit ▪ Refer to the electrical circuit diagrams and check the electric park brake right actuator circuit for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park brake control module right actuator power and ground circuits for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park brake control module connectors for damage or corrosion ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake right actuator as required ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module as required
C2007-11	Right Motor - Circuit short to ground	**NOTE:** Circuit reference - RH MOTOR +VE / RH MOTOR -VE - ▪ Electric park brake right actuator circuit short circuit to ground ▪ Electric park brake right actuator internal failure ▪ Electric park brake control module internal failure	▪ Refer to the electrical circuit diagrams and check the electric park brake right actuator circuit for short circuit to ground ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake right actuator as required ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module as required
C2007-12	Right Motor - Circuit short to battery	**NOTE:** Circuit reference - RH MOTOR + / RH MOTOR - ▪ Electric park brake right actuator circuit short circuit to power ▪ Electric park brake control module connector short circuit to power ▪ Electric park brake control module connector pins corroded ▪ Electric park brake control module internal failure	▪ Refer to the electrical circuit diagrams and check the electric park brake right actuator circuit for short circuit to power ▪ Refer to the electric circuit diagrams and check the electric park brake control module connector for short circuit to power ▪ Refer to the electrical circuit diagrams and check the electric parking brake control module connector pins for corrosion ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module as required

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
C2007-13	Right Motor - Circuit open	**NOTE:** Circuit reference - VBATT MOTOR RH - ▪ Fuse failure ▪ Electric park brake control module right actuator power circuit open circuit, high resistance ▪ Electric park brake control module connectors damaged or corroded ▪ Electric park brake control module internal failure	▪ Refer to the electrical circuit diagrams and check the electric park brake control module right power supply fuse and circuit ▪ Refer to the electrical circuit diagrams and check the electric park brake control module right actuator power circuit for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park brake control module connectors for damage or corrosion ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module as required
C2007-16	Right Motor - Circuit voltage below threshold	**NOTE:** Circuit reference - RH MOTOR + / RH MOTOR - / VBATT MOTOR RH / RH MOTOR GND - ▪ Fuse failure ▪ Electric park brake right actuator circuit open circuit, high resistance ▪ Electric park brake control module connectors damaged or corroded ▪ Electric park brake control module right actuator power or ground circuit open circuit, high resistance ▪ Electric park brake right actuator internal failure ▪ Battery/charging system fault ▪ Park brake control module internal failure	▪ Refer to the electrical circuit diagrams and check the electric park brake control module right power supply fuse and circuit ▪ Refer to the electrical circuit diagrams and check the electric park brake right actuator circuit for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park brake control module connectors for damage or corrosion ▪ Refer to the electrical circuit diagrams and check the electric park brake control module right actuator power and ground circuits for open circuit, high resistance ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake right actuator as required ▪ Refer to the relevant section of the workshop manual and test the battery and charging system ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module as required
C2007-18	Right Motor - Circuit current below threshold	**NOTE:** Circuit reference - RH MOTOR +VE / RH MOTOR -VE / VBATT MOTOR RH / GND MOTOR R - ▪ Electric park brake right actuator circuit open circuit, high resistance ▪ Electric park brake control module right actuator power or ground circuit open circuit, high resistance ▪ Electric park brake right actuator failure ▪ Battery/charging system fault	▪ Refer to the electrical circuit diagrams and check the electric park brake right actuator circuit for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park brake control module right actuator power and ground circuits for open circuit, high resistance ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake right actuator ▪ Refer to the relevant section of the workshop manual and test the battery and charging system

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
C2007-19	Right Motor - Circuit current above threshold	**NOTE:** Circuit reference - RH MOTOR +VE / RH MOTOR -VE - ▪ Electric park brake right actuator circuit short circuit to ground, short circuit to power ▪ Electric park brake right actuator failure	▪ Refer to the electrical circuit diagrams and check the electric park brake right actuator circuit for short circuit to ground, short circuit to power ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake right actuator
C2007-1D	Right Motor - Circuit current out of range	▪ Electric park brake right actuator failure	▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake right actuator
C2008-01	Left Motor - General electrical failure	**NOTE:** Circuit reference - LH MOTOR + / LH MOTOR - / VBATT MOTOR LH / LH MOTOR GND - ▪ Fuse failure ▪ Electric park brake left actuator circuit open circuit, high resistance ▪ Electric park brake control module left actuator power or ground circuit open circuit, high resistance ▪ Electric park brake control module connector damaged or corroded ▪ Electric park brake left actuator internal failure ▪ Electric park brake control module internal failure	▪ Refer to the electrical circuit diagrams and check the park brake control module left power supply fuse and circuit ▪ Refer to the electrical circuit diagrams and check the electric park brake left actuator circuit for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park brake control module left actuator power and ground circuits for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park control module connector for damage or corrosion ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake left actuator as required ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module as required
C2008-11	Left Motor - Circuit short to ground	**NOTE:** Circuit reference - LH MOTOR +VE / LH MOTOR -VE - ▪ Electric park brake left actuator circuit short circuit to ground ▪ Electric park brake left actuator internal failure ▪ Electric park brake control module internal failure	▪ Refer to the electrical circuit diagrams and check the electric park brake left actuator circuit for short circuit to ground ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake left actuator as required ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module as required
C2008-12	Left Motor - Circuit short to battery	**NOTE:** Circuit reference - LH MOTOR +VE / LH MOTOR -VE - ▪ Electric park brake left actuator circuit short circuit to power	▪ Refer to the electrical circuit diagrams and check the electric park brake left actuator circuit for short circuit to power

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
C2008-13	Left Motor - Circuit open	**NOTE:** Circuit reference - VBATT MOTOR LH - ▪ Fuse failure ▪ Electric park brake control module left actuator power circuit open circuit, high resistance ▪ Electric park brake control module connector damaged or corroded ▪ Electric park brake module internal failure	▪ Refer to the electrical circuit diagrams and check the park brake control module left power supply fuse and circuit ▪ Refer to the electrical circuit diagrams and check the electric park brake control module left actuator power circuit for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park brake control module connector for damage or corrosion ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module as required
C2008-16	Left Motor - Circuit voltage below threshold	**NOTE:** Circuit reference - LH MOTOR + / LH MOTOR - / VBATT MOTOR LH / LH MOTOR GND - ▪ Fuse failure ▪ Electric park brake left actuator circuit open circuit, high resistance ▪ Electric park brake control module left actuator power or ground circuit open circuit, high resistance ▪ Electric park brake control module connector damaged or corroded ▪ Electric park brake left actuator internal failure ▪ Battery/charging system fault ▪ Electric park brake control module internal failure	▪ Refer to the electrical circuit diagrams and check the park brake control module left power supply fuse and circuit ▪ Refer to the electrical circuit diagrams and check the electric park brake left actuator circuit for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park brake control module left actuator power and ground circuits for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park brake control module connector for damage or corrosion ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake left actuator as required ▪ Refer to the relevant section of the workshop manual and test the battery and charging system ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module as required
C2008-18	Left Motor - Circuit current below threshold	**NOTE:** Circuit reference - LH MOTOR +VE / LH MOTOR -VE / VBATT MOTOR LH / GND MOTOR L - ▪ Electric park brake left actuator circuit open circuit, high resistance ▪ Electric park brake control module left actuator power or ground circuit open circuit, high resistance ▪ Electric park brake left actuator failure ▪ Battery/charging system fault	▪ Refer to the electrical circuit diagrams and check the electric park brake left actuator circuit for open circuit, high resistance ▪ Refer to the electrical circuit diagrams and check the electric park brake control module left actuator power and ground circuits for open circuit, high resistance ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake left actuator ▪ Refer to the relevant section of the workshop manual and test the battery and charging system

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
C2008-19	Left Motor - Circuit current above threshold	**NOTE:** Circuit reference - LH MOTOR + / LH MOTOR - ▪ Electric park brake left actuator circuit short circuit to ground, short circuit to power or wires shorted together ▪ Electric park brake control module connector short circuit to ground, short circuit to power ▪ Electric park brake left actuator internal failure	▪ Refer to the electrical circuit diagrams and check the electric park brake left actuator circuit for short circuit to ground, short circuit to power or wires shorted together ▪ Refer to the electrical circuit diagrams and check the electric park brake control module connector for short circuit to ground, short circuit to power ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake left actuator as required
C2008-1D	Left Motor - Circuit current out of range	▪ Electric park brake left actuator failure	▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake left actuator
U0001-81	High Speed CAN Communication Bus - Invalid serial data received	▪ Invalid data received from another control module via the high speed CAN bus (powertrain)	▪ Using the Jaguar Land Rover approved diagnostic equipment, check the snapshot data to determine the invalid data source control module. Check the relevant control module for related DTCs and refer to the relevant DTC index
U0001-82	High Speed CAN Communication Bus - Alive/sequence counter incorrect / not updated	▪ Invalid data received from another control module via the high speed CAN bus (powertrain)	▪ Using the Jaguar Land Rover approved diagnostic equipment, check the snapshot data to determine the invalid data source control module. Check the relevant control module for related DTCs and refer to the relevant DTC index
U0001-87	High Speed CAN Communication Bus - Missing message	▪ Missing message from another control module via the high speed CAN bus (powertrain)	▪ Using the Jaguar Land Rover approved diagnostic equipment, check the snapshot data to determine the missing message source control module. Check the relevant control module for related DTCs and refer to the relevant DTC index
U0001-88	High Speed CAN Communication Bus - Bus off	▪ High speed CAN bus (powertrain) circuit short circuit to ground, short circuit to power, open circuit, high resistance	▪ Using the Jaguar Land Rover approved diagnostic equipment, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus (powertrain) circuit for short circuit to ground, short circuit to power, open circuit, high resistance
U0300-00	Internal Control Module Software Incompatibility - No sub type information	▪ Car configuration file mismatch with vehicle specification ▪ Incorrect electric park brake control module installed	▪ Using the Jaguar Land Rover approved diagnostic equipment, check and up-date the car configuration file as necessary ▪ Install a new electric park brake control module
U1A4C-00	Build / End of Line Mode Active - No sub type information	**NOTE:** This DTC is for use during production only ▪ Electric park brake control module in build / end of line mode	▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
U1A4C-68	Build / End of Line Mode Active - Event information	**NOTE:** This DTC is for use during production only ▪ Electric park brake control module in build / end of line mode	▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest
U2002-13	Switch - Circuit open	**NOTE:** Circuit reference - SW1 / SW2 / SW3 / SW4 - ▪ Electric park brake switch poor connection or disconnected ▪ Electric park brake switch circuit open circuit, high resistance ▪ Electric park brake switch internal failure	▪ Refer to the electrical circuit diagrams and check the electric park brake switch connector for poor connection or being disconnected ▪ Refer to the electrical circuit diagrams and check the electric park brake switch circuit for open circuit, high resistance ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear DTCs and retest. If the fault persists, install a new electric park brake switch as required
U2002-64	Switch - Signal plausibility failure	**NOTE:** Circuit reference - SW1 / SW2 / SW3 / SW4 - ▪ Electric park brake switch circuit short circuit to ground, short circuit to power, open circuit, high resistance ▪ Electric park brake switch stuck active ▪ Electric park brake switch internal failure ▪ Electric park brake control module internal failure	▪ Refer to the electrical circuit diagrams and check the electric park brake switch circuit for short circuit to ground, short circuit to power, open circuit, high resistance ▪ Test the operation of the electric park brake switch ▪ Using the manufacture approved diagnostic system, clear DTCs and retest. If the fault persists, install a new electric park brake switch as required ▪ Using the manufacture approved diagnostic system, clear DTCs and retest. If the fault persists, install a new electric park brake control module as required
U2002-67	Switch - Signal incorrect after event	▪ Electric park brake switch stuck active ▪ Electric park brake switch internal failure	▪ Test the operation of the electric park brake switch ▪ Install a new electric park brake switch

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
U2002-92	Switch - Performance or incorrect operation	**NOTE:** Circuit reference - SW1 / SW2 / SW3 / SW4 - ▪ Electric park brake switch needs to reset ▪ Electric park brake switch contaminated ▪ Electric park brake switch connector damaged, corroded or backed out terminals ▪ Electric park brake switch circuits short circuit to ground, short circuit to power, open circuit, high resistance ▪ Electric park brake switch internal failure	**NOTE:** Prior to carrying out any repair procedures, operate the electric park brake switch to the brake apply, brake release and neutral positions. If the fault does not clear carry out the following repair actions below ▪ With the ignition set to on, apply the electric park brake for a minimum of 10 seconds, then release. Clear the DTC and retest ▪ Check for any contamination/debris that may be causing the electric park brake switch to be stuck ▪ Disconnect the electric park brake switch and check for connector damage, corroded or backed out terminals. Clear the DTC and retest ▪ Refer to the electrical circuit diagrams and check the electric park brake switch circuits for short circuit to ground, short circuit to power, open circuit, high resistance ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear DTCs and retest. If the fault persists, install a new electric park brake switch as required
U2012-00	Car Configuration Parameter(s) - No sub type information	▪ Car configuration file mismatch with vehicle specification ▪ High speed CAN bus (powertrain) circuit short circuit to ground, short circuit to power, open circuit, high resistance ▪ Incorrect electric park brake control module installed	▪ Using the Jaguar Land Rover approved diagnostic equipment, check and up-date the car configuration file as required ▪ Using the Jaguar Land Rover approved diagnostic equipment, perform a CAN network integrity test. Refer to the electrical circuit diagrams and check the high speed CAN bus (powertrain) circuit for short circuit to ground, short circuit to power, open circuit, high resistance ▪ Using the Jaguar Land Rover approved diagnostic equipment clear DTCs and retest. If the fault persists, install a new electric park brake control module as required
U2016-05	Control Module Main Software - System programming failures	▪ Electric park brake control module failure	▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module
U2100-54	Initial Configuration Not Complete - Missing calibration	**NOTE:** This DTC is for use during production only ▪ Electric park brake control module assembly check not completed	▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module
U3000-00	Control Module - No sub type information	▪ Electric park brake control module incorrectly installed ▪ Loose mounting may cause the internal accelerometer to output an implausible signal and set this DTC ▪ Electric park brake control module failure	▪ Install the electric park brake control module correctly ▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module

DTC	DESCRIPTION	POSSIBLE CAUSES	ACTION
U3000-13	Control Module - Circuit open	▪ Electric park brake control module power or ground circuit open circuit, high resistance ▪ Battery/charging system fault	▪ Using the Jaguar Land Rover approved diagnostic equipment, check datalogger signal - ECU Power Supply Voltage (D111). Refer to the electrical circuit diagrams and check the electric park brake control module power and ground circuits for open circuit, high resistance ▪ Refer to the relevant section of the workshop manual and test the battery and charging system
U3000-48	Control Module - Supervision software failure	▪ Electric park brake control module failure	▪ Using the Jaguar Land Rover approved diagnostic equipment, clear the DTCs and retest. If the fault persists, install a new electric park brake control module
U3000-54	Control Module - Missing calibration	▪ Electric park brake control module is not configured correctly	**NOTE:** Ensure the vehicle is parked on level ground and the electric park brake control module mounting position is correct, before trying to calibrate ▪ Using the Jaguar Land Rover approved diagnostic equipment, re-configure the electric park brake control module with the latest level software
U3000-55	Control Module - Not configured	▪ Electric park brake control module is not configured correctly	▪ Using the Jaguar Land Rover approved diagnostic equipment, re-configure the electric park brake control module with the latest level software
U3000-78	Control Module - Alignment or adjustment incorrect	▪ Electric park brake control module mounting position incorrect ▪ Electric park brake control module longitudinal accelerometer calibration incorrect ▪ Electric park brake control module failure	▪ Check that the Electric park brake control module is mounted correctly. Rectify if needed. Ensure that vehicle is parking on level surface and free from vibration. Run the calibration routine Parking Brake - Longitudinal accelerometer calibration (211D) from the manufacturer approved diagnostic tool. Clear the DTCs and retest ▪ If the fault persists, renew the Electric park brake control module
U3006-16	Control Module Input Power A - Circuit voltage below threshold	▪ Electric park brake control module power or ground circuit open circuit, high resistance ▪ Battery/charging system fault	▪ Using the Jaguar Land Rover approved diagnostic equipment, check datalogger signal - ECU Power Supply Voltage (D111). Refer to the electrical circuit diagrams and check the electric park brake control module power and ground circuits for open circuit, high resistance ▪ Refer to the relevant section of the workshop manual and test the battery and charging system
U3006-17	Control Module Input Power A - Circuit voltage above threshold	▪ Battery/charging system fault	▪ Using the Jaguar Land Rover approved diagnostic equipment, check datalogger signal - ECU Power Supply Voltage (D111). Refer to the relevant section of the workshop manual and test the battery and charging system
U300A-62	Ignition Switch - Signal compare failure	**NOTE:** Circuit reference - IGN - ▪ Mismatch between the hardwired ignition signal to the electric park brake control module and the value broadcast on the powertrain high speed CAN bus	▪ Refer to the electrical circuit diagrams and check the electric park brake control module ignition signal circuit for short circuit to ground, short circuit to power, open circuit, high resistance
